The photochemical reaction requires to occur a minimum amount of energy is needed called as activation energy. This energy is provided either by heat or by light (hv).

In an organic molecule electrons are present in s, p or n Orbitals (bonding and non bonding). But when organic molecule exposed to light, the molecule undergoes excitation i.e. an electron is promoted to antibonding orbital.

The different types of transition possible in organic molecule with the energy order:

$\sigma \rightarrow \sigma^*$ > $\pi \rightarrow \pi^*$ > $n \rightarrow \pi^*$ > $\pi \rightarrow \sigma^*$
